The RFXANK gene is mutated in complementation group B MHC II deficiency patients. Mutations identified in patients include aberrant splicing and short deletions in exon 6. The representation provides inhibitors of RFXANK including antibodies, single chain antibodies, dominant negative mutants, antisense molecules and ribozymes. The inhibitors may be used in therapy or prevention of diseases associated with aberrant expression of MHC class II genes and/or as an immunosuppressive agents, e.g. to treat corgans, insulin dependent diseases or rejection of transplanted erythematosus and rheumatoid arthritis. The compositions may also be used to treat the autosomal recessive disease MHC class II deficiency. Since RFXANK does not play any other major role in the transcriptional control of genes other than MHC class II genes, its inhibitors are devoid of other undesirable inhibitory effects.
                                                                                                           953

CC This sequence is the human ankyrin family protein, ANFP, of the CC invention. Host cells containing an expression vector containing the polynucleotide sequence can be cultured to produce ANFP, which can be CC used for diagnosis or treatment of autoimmune, inflammatory, containing the CC used for diagnosis or treatment of autoimmune, inflammatory, proliferative and vesicle-trafficking disorders. Disorders which can be CC treated include acquired immune deficiency syndrome (AIDS), allergies, can attend to the containing the containing treatment of autoimmune, inflammatory, allergies, conservations, asthma, atherosclerosis, bronchitis, Crohn's conservation processes, atopic dermatitis, diabetes mellitus, irritable bowel syndrome, converted arthritis, cirrhosis, hepatitis, ulcerative colitis, cancer and confident to the polynucleotide sequences can also be used as a hypercholesterolaemia. The polynucleotide sequences can also be used as a hypercholesterolaemia. The polynucleotide sequence of the sequence of pharmaceutical agents to find agents that specifically bind and its antisense sequence can be used in therapeutic compositions e.g. to regulate gene function. The DNA sequence can be used for diagnostic purposes to detect and quantitate gene expression in consisted tissues and to indicate the absence, presence and excess confidence in the consistence and excess confidence in the consistence can be used to intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Matc

SCI INC

SEQ ID No 3013; 2922pp; English.

recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigen; and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast-related disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and cyainitis), immune disorders (e.g., congenital and acquired immunedficiencies, autoimmune ophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders, cand urinary system disorders. Ovarian antigen polypeptides and cyolynucleotides may also be used in screening for compounds which to the sequen recombinant v polynucleotid of ovarian an The invention ABP43228) and encompasses and to cDNAs n relates to 2175 novel human ovarian antigens (ABP41054-d to cDNAs encoding them (ABQ54131-ABQ56305), and also polypeptides 90% identical and polynucleotides 95% identical nces of the invention. The invention additionally relates to vectors and host cells comprising human ovarian antigen des, antibodies against human ovarian antigens, and the use

                                                                                                                                                                                                                                                                                                                                        Human ankyrin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modulate ovarian antigen expression or activity. The polynucleotide further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The pusequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the puspecification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

invention describes primer sets for synthesising 5602 cDNAs defined in the specification. Where a primer set (a) an oligo-dT primer and an oligonucleotide complementary plementary strand of a polynucleotide which comprises one of acleotide sequences defined in the specification, where the ptide comprises at least 15 nucleotides; or (b) a combination nucleotide comprising a sequence complementary to the proposed of a polynucleotide which comprises a 5'-end

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                       (HUMA-) HUMAN GENOME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      165

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoding human secreted proteins (II). (I) and (II) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (I) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the secreted proteins. The anti-(II) antibodies and antagonists may also be used to down regulate expression and activity of (II). The anti-(II) antibodies may also be used to the secreted to

                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence for a human transcription factor. The transcription factor and its coding sequence are useful in the diagnosis, treatment and prevention of diseases associated with altered expression of the transcription factor e.g. cell proliferative, autoimmune/inflammatory, neurological and developmental disorders. A number of specific disorders/diseases are given in the specification, including: arteriosclerosis, cirrhosis, hepatitis, cancers, AIDS, allergies, anaemia, asthma, autoimmune thyroiditis, bronchitis, atopic dermatitis, diabetes mellitus, emphysema, Goodpasture's syndrome, gout, grave's disease, multiple sclerosis, osteoarthritis, pancreatitis, psoriasis, rheumatoid arthritis, systemic lupus erythematosus, ulcerative colitis, uveitis, Alzheimer's disease, Huntington's disease, Parkinson's disease, stroke, and viral, bacterial, fungal and protozoal infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

                                                                                                                                                   ş
                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                The invention relates to novel isolated nucleic acid molecules (I) encoding human secreted proteins (II), (I) and (II) are used to prevent, treat or amelicate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (I) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the secreted proteins. The anti-(II) antibodies and antagonists may also be used to down regulate expression and activity of (II). The anti-(II) antibodies and antagonists may also be used to down regulate expression and activity of (II). The anti-(II) antibodies and manulations immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. HIV disorders include for example: immunosorbant assay (ELISA)). The disorders disease, neurological diseases (e.g. Alzheimer's disease, neurological diseases (e.g. Alzheimer's disease, neurological diseases (e.g. Alzheimer's disease, antipolymer's disease and Charcot-Marie-Tooth disease), cardio-/cardio-/cardio-maintain organs before transplantation, and support cell culture of primary tissues. ANU20342-ANU20666 represent human secreted protein amino acid sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from WIPO at: ff. fr. wipo.int/pub/published_pct_sequences.

                           cogoats, horses, cats, dogs, chickens or sheep. (1) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (I) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antipodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the secreted. (II) antibodies and antagonists may also be used as antipodies may also be used as diagnostic agents for detecting the presence of (II) samples (e.g. by enzymel linked immunosorbant assay (ELISA)). The disorders include for example: immune/autoimmune diseases (e.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. may and thrombosis), infections caused by bacteria, viruses and carocters and hyperproliferative disorders (e.g. markinson's disease) neurological diseases (e.g. Alzheimer's disease, parkinson's disease and Charcot Marie-Tooth disease), cardio-

Cerebrovascular disorders (e.g. corneal infections). (I) and (II) agonists, antagonists and antibodies can also be used to promote wound healing, maintain organs before transplantation, and support cell culture of primary tissues. ANU20342-ANU20366 represent human secreted protein cannot acid sequences, and related sequences of the invention.

Company and charaction but was obtained in electronic format directly from WIPO at: fifty wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunomodulatory; human immunodeficiency virus; HIV; anaemia; angin rheumatoid arthritis; antiarteriosclerotic; cardiant; vascular; cerebroprotective; thrombolytic; antimicrobial; ophthalmological; cytostatic; Alzheimer's disease; Parkinson's disease; human; cancer multiple sclerosis; cancer; hyperproliferative disorder; infection; Gaucher's disease; neurological disease; cerebrovascular disorder; thrombosis; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids and polypeptides, useful for diagnosing, preventing or treating medical conditions -

                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTs). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat infertility, to regulate activin or inhibin e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antianaemic; vulnerary; antiinflammatory; immunomodulato; antiinfertility; cerebroprotective; cytostatic; rheumatic; gene neuroprotective; antiparkinsonian; protein therapy; EST; expressed sequence tag.

                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exconnucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                             The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                               Sequence
                                                                                                                 Note: The sequence data for this patent did specification, but was obtained in electroni at ftp.wipo.int/pub/published_pct_sequences.
